**Key words.** astroparticle physics – Sun: activity – cosmic rays – errata, addenda

Ghelfi et al. (2016) performed a global analysis of top-of-atmosphere data (with the recent PAMELA, BESS, and AMS-02 data) to obtain H and He interstellar (IS) fluxes and their uncertainties. A simple parametric formula was provided for the IS fluxes (shown in their Fig. 5) because they are of interest for a wide range of astrophysics problems. However, the parametric form of Eq. (8) contains an error and all coefficients  $c_{12}$  and  $\tilde{c}_0$  in Table 3 are incorrect.

The new Eq. (1) and Table 1 below replace Eq. (8) and Table 3 of Ghelfi et al. (2016):

$$\log_{10}(J_{\text{IS}}) = \begin{cases} \sum_{i=0}^{14} c_i \times \left( \frac{\log_{10}(E_{k/n})}{\log_{10}(800)} \right)^i & \text{if } E_{k/n} < 800 \text{ GeV/n} \\ \tilde{c}_0 - \tilde{c}_1 \log_{10} \left( \frac{E_{k/n}}{800} \right) & \text{otherwise.} \end{cases} \quad (1)$$

As discussed in Ghelfi et al. (2016), the first five columns of Table 1 are coefficients for the median and 1- and  $2\sigma$  credible intervals from the Markov chain Monte Carlo (MCMC) analysis (without Voyager data), to be considered as a high estimate of the H and He IS fluxes (not valid below 400 MeV/n). The last column provides the best-fit including Voyager data (assumed interstellar), to be considered as a low estimate of the IS H and He fluxes.
